Class 6

1

Roadmap- Class 6

- Clarifications from last class
- Log Book volunteer
- Review of test
- Configuration Management
- Testing
- Reading: BY Chapter 11
- Reading next class: Brooks Chapters 7, 8, 9, 10 and BY 5, pp 223-247

Class 6

2

Clarifications

- Thought Problem

Class 6

3

Thought Problem

- Your company does not have a Quality program, lately there have been some issues with software Quality and your Director has asked you to institute a program for your company. What is your plan?

Class 6

4

Calendar -Key Dates

- November 7th - second test
- November 21st - log books due
- December 12th - final exam

Class 6

5

Logbook

- Your Entry
- Succession Planning

Class 6

6

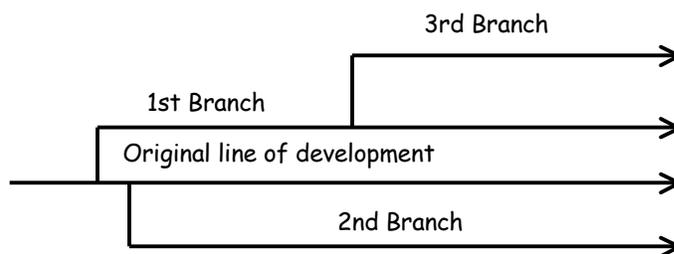

Configuration Management the Problem

- Not a simple task!
 - Different versions of software usually is in the field during the life cycle
 - Different parts of the team are on different versions of the software and documents (see branching)
 - The same release of a software product may have multiple versions consisting of different combinations of software components
- Configuration management is both a development and production issue, a life time issue

Class 6

7

Branches of Development

From Collins-Sussman, et.al., 2005

Class 6

8

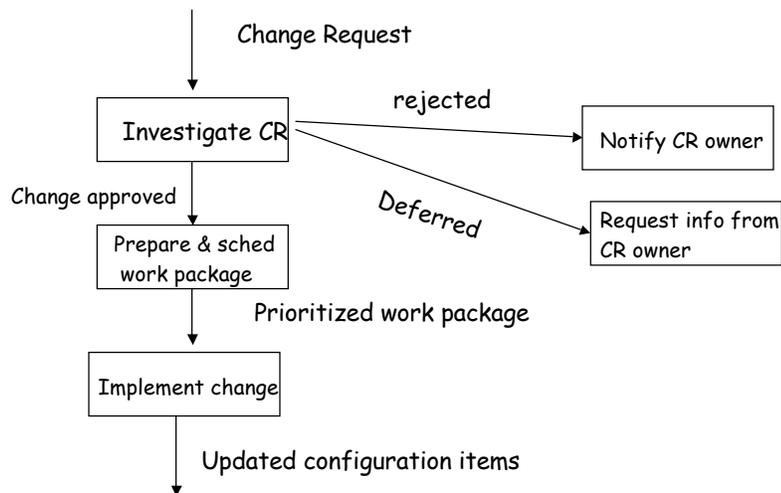

The Baseline

- IEEE - "reviewed and agreed upon basis for further development which can be changed only through formal control procedures"
- Contained in the baseline are configuration items: source, objects, requirements
- Configuration management maintains integrity of these artifacts
- Major error- retrace steps through code, design documents and requirements specification - **TRACEABILITY**

Class 6

9

Workflow of CR (MR)

Class 6

10

Configuration Management Tools

- **Manage the workflow of CRs**
- If item is to be changed, developer checks it out and item is locked to other users
- When item check back in revision history is stored
- All versions are recoverable
- Should be able to accommodate branching - necessary more times than you think!
- Configuration management tools are very sophisticated, keeps only the changes, the deltas and the remarks, timestamps and who did what - essential for Buildmeister and testers
- New tools are change oriented release configuration is identified by a baseline plus a set of changes.

Class 6

11

Configuration Management Plan

- **Main parts:**
 - **Management:**
 - How project is organized
 - **Activities:**
 - Who is on CCB, what are their responsibilities
 - What reports are required
 - **What data is collected and archived - IMPORTANT**
 - **Schedules**
 - **Resources**
 - **Plan Management**

Class 6

12

Software Testing

- Testing is the last bastion of Quality - you can not "test in" Quality however testing is a necessary but not sufficient condition for Quality
- Dijkstra "Testing can show the presence of bugs but not their absence!"
- The Quality of the systems we deliver increasingly determine the Quality of our existence
- Good testing is at least as difficult as good design (with asymmetric rewards)

Class 6

13

When to Test

- **NOW**
- Postponing testing *for too long* is a severe mistake.
- Boehm- errors discovered in the operational phase incur cost 10 to 90 times higher than design phase
 - Over 60% of the errors were introduced during design
 - 2/3's of these not discovered until operations
- Given care you can test requirements specification, design and design specification
 - Also prototypes, story boards and even macromedia demos test aspects of the spec, arch and design
- Which testing strategy? Finding errors or confidence in functioning of software?

Class 6

14

Types of Testing

- Coverage based - coverage of product, e.g., all statements must be executed at least once
- Fault based- detect faults, artificially seed and determine whether tests get at least X% of the faults
- Error based - focus on typical errors such as boundary values (off by 1) or max elements in list
- Black box - function, specification based, test cases derived from specification - system testing
- White box - structure, program based, testing considering internal logical structure of the software - unit testing

Class 6

15

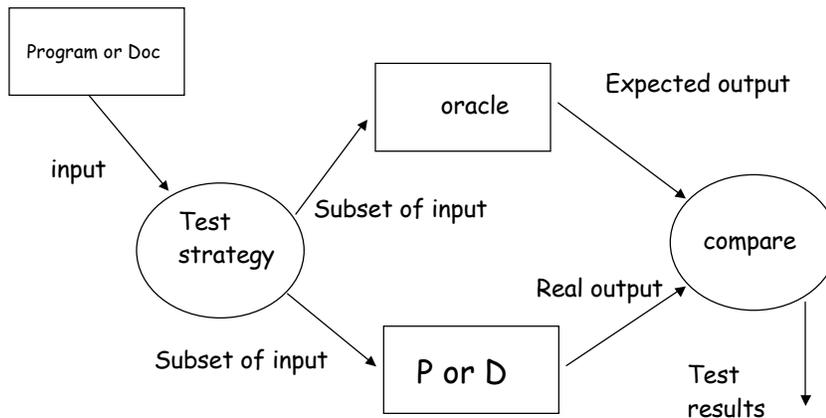

Testing Vocabulary

- Error - human action producing incorrect result
- Fault is a manifestation of an error
- Failure - sometime encountering a fault causes a failure, hard to define failure, it is relative and we must be aware of the standard
- "Due to an error by Gregg a fault was introduced in the software and when the fault was encountered, it caused the current failure."
- Verification "The process of evaluating a system or component to determine whether the products of a given development phase satisfy conditions imposed at the start of the phase" e.g., ensure software correctly implements a certain function- have we built the system right
- Validation "The process of evaluating a system or component during or at the end of development process to determine whether it satisfies specified requirements", e.g., software built traceable to customer requirements - have we built the right system

Class 6

16

Global View of Test Process from van Vliet

Class 6

17

Test Adequacy Criteria

- Critical to select subset of input domain that will be the test set
- Test techniques generally use a systematic way to generate test cases - each fault is not equally hazardous.
- Test adequacy criteria specify requirements for testing, e.g., stopping rule, measurement, test case generator - all closely linked to techniques

Class 6

18

Fault Detection vs. Confidence Building

- **Tension:** intention is to provoke failure behavior - a good strategy for fault detection but does not inspire confidence
- User wants failure free behavior - high reliability
 - Frequently manifesting faults cause more damage (or workarounds)
 - Mimic the situation through random testing of scenarios

Class 6

19

Cleanroom Techniques

- Developer cannot execute code - convinced of correctness through manual techniques
- These modules are integrated and tested by someone else using input that was generated to follow the distribution of actual use - goal is to achieve a given reliability level

Class 6

20

Fault Detection to Fault Prevention

- Historical progression, in early days testing and debugging

MODEL	GOAL
Phase: -Demonstration -Destruction	Software satisfies spec Detect implementation faults
Life Cycle: -Evaluation -Prevention	Detect R, D & I faults Prevent R, D & I faults

Class 6

21

Phase Models

- Demonstration - if it runs test set, it is good, purpose to convince someone there are no errors - dangerous
- Proper testing is destructive, you want to find errors.
 - Find as many faults as possible, look for test cases that reveal faults
 - Difficult to decide when to stop testing
 - When budget is exhausted or time runs out?
 - When all test cases pass
 - Usually has a systematic way to develop test cases

Class 6

22

Lifecycle Models

- Evaluation oriented - emphasis on detecting faults in evaluation and design
- Prevention oriented - early design of test cases, careful planning and design of test activities
- Over years we are moving from demonstration to prevention
- BUT testing is still concentrated late in the development cycle (move to the left, NOT!)
- Testing is not only about errors but also about knowledge

Class 6

23

Requirements Engineering

- Review or inspection to check that all aspects of the system have been described
 - Scenarios with prospective users resulting in functional tests
- Boehm's criteria for functional specification: consistency, completeness, feasibility, testability -- testing a requirements specification test these criteria
- Common errors in a specification:
 - Missing information
 - Wrong information
 - Extra information
- During requirements testing phase, testing strategy for other phases is generated: test techniques, plan, scheme and documentation

Class 6

24

Boehm's Criteria

- Completeness- all components present and described completely - nothing pending
- Consistent- components do not conflict and specification does not conflict with external specifications --internal and external consistency. Each component must be traceable
- Feasibility- benefits must outweigh cost, risk analysis (safety-robotics)
- Testable - the system does what's described
- Beginnings of ICED-T

Class 6

25

Traceability Tables

- Features - requirements relate to observable system/product features
- Source - source for each requirement
- Dependency - relation of requirements to each other
- Subsystem - requirements by subsystem
- Interface requirements relation to internal and external interfaces
- Part of a requirements database, how a change in a requirement affects aspects of the system

Class 6

26

Traceability Table: Pressman

	SUBSYSTEM		
R E Q U I R E M E N T S	S01	S02	S03...
R01	X		
R02	X		X
R03...		X	

Class 6

27

Testing and Design

- Similar criteria to requirements
- Documentation standards help in this process (see previous tables)
- With refinement tests should become more detailed
- Test for the future in architecture/high level design (remember SARB goals)
 - scenarios for anticipated change
- Test design
 - Tracing back to requirements
 - Simulation
 - Design walk throughs and inspections

Class 6

28

Testing and Implementation

- "real" testing, some techniques:
 - Read the code to find errors
 - Walk throughs -- Inspections
 - Stepwise abstraction - what does the code do
 - Static tools - inspect code without execution
 - Dynamic - run the code
 - Test for correctness through formal verification

Class 6

29

Testing and Maintenance

- More than 50 % of the time spent in maintenance
- Modification causes another round of tests - regression tests
 - Library of previous test plus adding more (especially if the fix was for a fault not uncovered by previous tests)
 - Issue is whether to retest all vs selective retest, expense related decision (and state of the architecture design related decision -- if entropy is setting in you better test)

Class 6

30

V&V Planning and Documentation

- Where test activities are planned
- IEEE 1012 specifies what should be in Test Plan
- Test Design Document specifies for each software feature the details of the test approach and lists the associated tests
- Test Case Document lists inputs, expected outputs and execution conditions
- Test Procedure Document lists the sequence of action in the testing process
- Test Report states what happened
- In smaller projects many of these can be combined

Class 6

31

IEEE 1012

1. Purpose
2. Referenced Documents
3. Definitions
4. V&V overview
 1. Organization
 2. Master schedule
 3. Resources summary
 4. Responsibilities
 5. Tools, techniques and methodologies
5. Life cycle V&V
 1. Management of V&V
 2. Requirements phase V&V
 3. Design phase V&V
 4. Implementation V&V
 5. Test phase V&V
 6. Installation and checkout phase V&V
 7. O&M V&V
6. Software V&V Reporting
7. V&V admin procedures
 1. Anomaly reporting and resolution
 2. Task iteration policy
 3. Deviation policy
 4. Control procedures
 5. Standard practices and conventions

Class 6

32

Manual Test Techniques

- Reading - peer review, insight via best and worst technique (2 good, 2 marginal, can developers detect marginal code)
- Walkthroughs and Inspections *
- Scenario Based Evaluation (SAAM)*
- Correctness Proofs
- Stepwise Abstraction from code to spec

Class 6

33

Inspections

- Sometimes referred to as Fagan inspections
- Basically a team of about 4 folks examines code statement by statement
 - Code is read before meeting
 - Meeting is run by a moderator
 - 2 inspectors or readers paraphrase code
 - Author is silent observer
 - Code analyzed using checklist of faults: wrongful use of data, declaration, computation, relational expressions, control flow, interfaces
- Results in problems identified that author corrects and moderator reinspects
- **Maintain constructive attitude - not used in programmer's assessment**

Class 6

34

Walk Throughs

- Guided reading of code using test data to run a "simulation"
- Generally less formal
- Learning situation for new developers
- Parnas advocates a review with specialized roles where the roles define questions asked - proven to be very effective

Class 6

35

The Value of Inspections/Walk-Thrus (Humphrey 1989)

- Inspections are up to 20 times more efficient than testing
- Code reading detects twice as many defects/hour as testing
- 80% of development errors were found by inspections
- Inspections resulted in a 10x reduction in cost of finding errors

Class 6

36

SAAM

- Software Architecture Analysis Method
- **Scenarios that describe both current and future behavior**
- Classify the scenarios by whether current architecture directly (full support) or indirectly supports it
- Develop a list of changes to architecture/high level design - if semantically different scenarios require a change in the same component, this may indicate flaws in the architecture
 - **Cohesion** glue that keeps modules together - low=bad
 - Functional cohesion all components contribute to the single function of that module
 - Data cohesion - encapsulate abstract data types
 - **Coupling** strength of inter module connections, loosely coupled modules are easier to comprehend and adapt, low=good
- Overall evaluation is produced

Class 6

37

Coverage Based Techniques

- Adequacy of testing based on coverage, percent statements executed, percent functional requirements tested
- All paths coverage is an exhaustive testing of code
- Control flow coverage:
 - All nodes coverage, all statements coverage recall Cyclomatic complexity graphs
 - All edge coverage or branch coverage, all branches chosen at least once
 - Multiple condition coverage or extended branch coverage covers all combinations of elementary predicates
 - Cyclomatic number criterion tests all linearly independent paths

Unit testing

Class 6

38

Coverage Based Techniques -2

- **Data Flow Coverage** - considers definitions and use of variables
 - A variable is defined if it is assigned a value in a statement
 - A definition is alive if the variable is not reassigned at an intermediate statement and it is a definition clear path
 - Variable use P-use (as a predicate) C-use (as anything else)
 - Testing each possible use of a definition is all-uses coverage
 - Requiring each definition path to be a simple cycle at most is all DU (Definition Uses) paths coverage
 - Many variants of these

Class 6

39

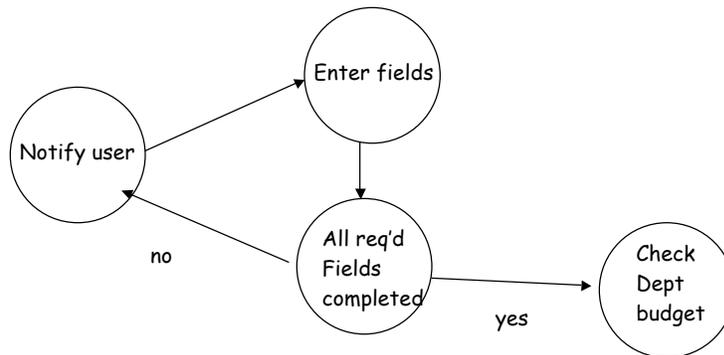

Coverage Based Testing of Requirements

- **Requirements can be transformed to a graph model** with nodes denoting elementary requirements and edges denoting relations between elementary requirements
- Use this model to derive test cases and apply control flow coverage

Class 6

40

Model of Requirements Specification

Class 6

41

Fault Based Techniques

- Do not directly consider artifact tested, it is all about the **test set**
- Find a test set that is great at finding faults:
 - Fault seeding
 - Mutation testing

Class 6

42

Fault Seeding

- Effort to estimate faults in a program
- Artificially seed faults, test to discover both seeded and new faults
- Total # of errors = $((\text{tot err found} - \text{tot seed err found}) * \text{tot seed err}) / \text{tot seed err found}$
- Assumes real and seeded errors have same distribution
- Manually generating faults may not be effective
- Alternative is 2 groups, real faults found by X used as seeded faults by Y
- If we find many seeded faults and few others - results trusted, converse not true
- Many real faults found is not a positive sign - Poor Q
- **Myers- probability of more errors in a section is proportional to the # of errors already found!**

Class 6

43

Mutation Testing

- Large # of variants of a program are generated by a set of transformation rules, e.g, replace constant by another, insert unary operator, delete statement
- "mutants" are executed using test set
- "mutants" producing same results as test expects are alive- if a test set leaves many alive it is poor, mutant adequacy score $\text{dead mutants} / \text{total mutants}$
- **Based on 2 assumptions:**
 - Competent programmer hypothesis - programs are close to correct - test small variants
 - Coupling effects hypothesis - tests that reveal simple faults can also reveal complex faults

Class 6

44

Orthogonal Array Testing

- Intelligent selection of test cases
- Fault model being tested is that simple interactions are a major source of defects
 - Independent variables - factors and number of values they can take -- if you have four variables, each of which could have 3 values, exhaustive testing would be 81 tests (3x3x3x3) whereas OATS technique would only require 9 and would test all pairwise interactions

Class 6

45

<http://www.seilevel.com/OATS.html>

OATS Table

	A	B	C	D
Run 1	0	0	0	0
Run 2	0	1	1	2
Run 3	0	2	2	1
Run 4	1	0	1	1
Run 5	1	1	2	0
Run 6	1	2	0	2
Run 7	2	0	2	2
Run 8	2	1	0	1
Run 9	2	2	1	0

Class 6

46

OATS Method

1. How many independent variables (factors)
2. How many values will each variable have (levels)
3. Find a suitable orthogonal array -- premade tables
4. Map 1 & 2 onto array
5. Transcribe runs into test cases adding "obvious omissions" *due to your knowledge*
6. (simplified)

Class 6

47

Test Adequacy Criteria

- Weyuker's properties:
 - Applicability -adequate test set for every program of reasonable size
 - Non-exhaustive applicability-do not require exhaustive testing
 - Monotonicity - for adequately tested software, more tests cause no harm
 - Inadequate empty set property- no tests = not adequately tested!

Class 6

48

Weyuker -2

- Antiextensionality - semantic equivalence does not always permit using same test, e.g., sort
- General multiple change - same syntax/ data flow does not equal same test (arithmetic ops)
- Antidecomposition - component test is environment specific
- Anticomposition - unit testing still requires composition testing (interfaces and interactions)
- Renaming - if 2 programs differ in nonessential ways (variable names) same test sets are okay
- Complexity - more complex, more tests
- Statement coverage - every executable statement should be executed in testing

Class 6

49

More on Testing

- Testing begins at component level and works outward (other direction is okay too)
- Different techniques are used at different points
- Testing involves the developer and an independent team and user advocates
- Testing and debugging are different but debugging must be accommodated
- Testing is the last bastion of Quality
- Quality cannot be "tested in"

Class 6

50

Top-down and Bottom-up

	Bottom-up	Top-down
Major Features	<ul style="list-style-type: none"> • Allows early testing aimed at proving feasibility and practicality of particular modules. • Modules can be integrated in various clusters as desired. • Major emphasis is on module functionality and performance. 	<ul style="list-style-type: none"> • The control program is tested first • Modules are integrated one at a time • Major emphasis is on interface testing
Advantages	<ul style="list-style-type: none"> • No test stubs are needed • It is easier to adjust manpower needs • Errors in critical modules are found early 	<ul style="list-style-type: none"> • No test drivers are needed • The control program plus a few modules forms a basic early prototype • Interface errors are discovered early • Modular features aid debugging
Disadvantages	<ul style="list-style-type: none"> • Test drivers are needed • Many modules must be integrated before a working program is available • Interface errors are discovered late 	<ul style="list-style-type: none"> • Test stubs are needed • The extended early phases dictate a slow manpower buildup • Errors in critical modules at low levels are found late

Class 6

51

Types of Testing

- Unit testing - adjunct to coding, uses drivers and stubs, test cases source controlled
- Integration testing - test to uncover errors in interfacing
- Regression testing - subset of all tests to a given point to use when changes are made (part of build - smoke testing)
- Validation testing - succeeds when software functions in a manner that can be reasonably expected by the customer.. Alpha and beta testing are part of this
- System testing fully exercise the entire system:
 - Recovery testing - OA&M
 - Security testing
 - Stress testing
 - Performance testing
 - Reliability testing

Class 6

52

Some Specialized Tests

- Testing GUIs
- Testing of Client server architectures
- Testing documentation and help facilities
- Testing real time systems
- Acceptance test
- Conformance test
- Your favorite here

Class 6

53

BY Heuristics

- Test incrementally
- Test under no load (but very long), little load, medium load, heavy load, over load - break it!
- Test error recovery code
- Spend more time testing stability and recovery than features
- Diabolic Testing - use data you do not expect the program to see
- Reliability testing to gauge [rejuvenation level](#)
- Regression testing - testing 50% of development time and 20% of costs, regression testing cuts this in half

Class 6

54

Extreme Testing (sort of)

- J.A. Whittaker, How to break software. A different viewpoint
- How good testers do testing - flexible testing, not about rigid test plans - not an exact science
- "smart people doing exploratory testing have found all the best bugs I have ever seen"
- The difference between users and testers is that testers have clear goals
- Relies on a general software fault model
 - Familiar with the environment in which software operates
 - Understand capabilities of the application

Class 6

55

Break Software - 2

- The Human User
 - Inputs delivered via GUI control
 - Inputs delivered by programs - through the API (developer as user), e.g., tools
- The File System User
 - E.g. file permissions
- The Operating System User
 - E.g., application works in low memory situations
- The Software User
 - E.g., external relational database - can it handle the data coming back?

Class 6

56

Break Software - 3

- **Software performs 4 basic tasks:**
 - Accepts input from environment - test input
 - Produces output and transmits it to its environment - test output
 - Stores data internally in one or more data structures - test data
 - Performs computation using input and stored data - test computation

Class 6

57

Break Software -4

- **Examples for user interface:**
 - Apply inputs that force all error messages to occur
 - Apply inputs that force the software to establish default values
 - Explore allowable character sets and data types
 - Overflow input buffers
 - Find inputs that may interact and test combinations of their values
 - Repeat the same input or series of inputs numerous times (consume resources)
 - ...

Class 6

58

Thought Problem

- A new manager heads testing and development and she believes in the SEI goal of "moving to the left" especially for testing. How would you get testing moved to the left?
- Do you think mutation testing would have any value in your current testing environment? Which phase of testing would it be most appropriate, unit, integration, system?

Class 6

59

So Far

- Software Process Models, Software Project Planning (woosh!), Requirements, Estimation, Risk Analysis, Multics case study, Architecture Reviews, Questionnaire Design
- Software Quality Assurance
- This Time: Configuration Management and Testing
- Next Time: Architecture and Design

Class 6

60
